

**Topo-Bathymetric Airborne Laser Scanning System**  
with Online Waveform Processing and Full Waveform Recording

# RIEGL VQ<sup>®</sup>-880-GH

- *designed for combined topographic and bathymetric airborne survey*
- *green laser scanner with up to 700kHz measurement rate*
- *IR laser scanner with up to 279kHz measurement rate and improved ranging performance*
- *high accuracy ranging based on echo digitization and online waveform processing with multiple-target capability*
- *multiple-time-around processing for straightforward mission planning and operation*
- *concurrent full waveform output for all measurements for subsequent full waveform analysis for the green channel*
- *integrated inertial navigation system*
- *up to two integrated digital cameras*
- *form factor with reduced height optimized for helicopter integrations*

The **RIEGL<sup>®</sup> VQ-880-GH** is a fully integrated airborne laser scanning system for combined topographic and bathymetric surveying. The system is offered with integrated and factory-calibrated high-end IMU/GNSS system and up to two cameras. The design allows flexible application of these components to meet specific requirements. Complemented by a **RIEGL** data recorder, the **RIEGL VQ-880-GH** LiDAR system is ready for straightforward installation on various platforms. Its compact form factor makes it specifically suitable for helicopter integration or use in small aircraft with limited space for sensor integration.

The **RIEGL VQ-880-GH** carries out laser range measurements for high resolution surveying of underwater topography with a narrow, visible green laser beam, emitted from a powerful pulsed laser source. Subject to clarity, at this particular wavelength the laser beam penetrates water enabling measurement of submerged targets.

The distance measurement is based on the time-of-flight measurement with very short laser pulses and subsequent echo digitization and online waveform processing. To handle target situations with most complex multiple echo signals, beside the online waveform processing the digitized echo waveforms can be stored on the **RIEGL** solid state data recorder for subsequent off-line waveform analysis. The laser beam is deflected in a circular scan pattern and hits the water surface at a nominally constant incidence angle.

The VQ-880-GH comprises a high precision inertial measurement sensor for subsequent precise estimation of the instrument's exact location and orientation. Two high-resolution digital cameras and an additional infrared laser scanner are integrated to supplement the data gained by the green laser scanner. The rugged internal mechanical structure together with the dust- und splash water proof housing enables long-term operation on airborne platforms.

#### Typical applications include

- *coastline and shallow water mapping*
- *acquiring base data for flood prevention*
- *measurement for aggradation zones*
- *habitat mapping*
- *surveying for hydraulic engineering*
- *hydro-archeological-surveying*

all dimensions in mm

## Export Classification

The Topo-Bathymetric Airborne Laser Scanner VQ-880-GH has been designed and developed for commercial topographic, hydrographic and bathymetric surveying applications.

## Laser Product Classification

Class 3B Laser Product  
according to IEC60825-1:2014

The following clause applies for instruments delivered into the United States: Complies with 21 CFR 1040.10 and 1040.11 except for conformance with IEC 60825-1 Ed.3., as described in Laser Notice No. 56, dated May 8, 2019.

The instrument must be used only in combination with the appropriate laser safety box.

NOHD <sup>1)</sup>

The VQ-880-GH is subject to export restrictions as set up by the Wassenaar Arrangement. It is classified as dual-use good according to position number 6A8j3 of the official Dual-Use-List to be found on site <http://www.wassenaar.org>. Within the European Union, Regulation (EU) No. 2021/821 implements the export restrictions of the Wassenaar Arrangement. The corresponding position number is **6A008j3**.

180 m <sup>2)</sup>

1) NOHD ... Nominal Ocular Hazard Distance, based upon MPE according to IEC60825-1:2014, for single pulse condition

2) NOHD is determined by green laser scanner, @ 80 lps, 1.1 mrad, 550 kHz; NOHD of the infrared laser scanner: 60 m @ 900 kHz

for each echo signal, high-resolution 16 bit intensity information is provided  
practically unlimited (details on request) <sup>13)</sup>  
1.064 nm (near infrared)  
0.3 mrad <sup>14)</sup>  
30 mm @ 100 m, 150 mm @ 500 m, 300 mm @ 1000 m

## Scanner Performance

Scanning Mechanism / Scan Pattern

Field of View (selectable)

Scan Speed (selectable)

Angular Step Width  $\Delta \theta$  (selectable)

between consecutive laser shots

Angle Measurement Resolution

rotating polygon mirror / curved parallel lines  
 $\pm 20^\circ = 40^\circ$   
28 - 200 scans/sec  
 $0.006^\circ \leq \Delta \theta \leq 0.042^\circ$  (for PRR 600 kHz)

better than  $0.001^\circ$  (3.6 arcsec)

- 3) The following conditions are assumed:  
target larger than the footprint of the laser beam, average ambient brightness, visibility 23 km, perpendicular angle of incidence.  
4) In bright sunlight, the operational range may be considerably shorter and the operational flight altitude may be considerably lower than under an overcast sky.  
5) Ambiguity to be resolved by post-processing with RiUNITE software.  
6) Reflectivity  $p \geq 20\%$ , 40° FOV, additional roll angle  $\pm 5^\circ$   
7) Limitations for range measurement capability does not consider laser safety.

- 8) Accuracy is the degree of conformity of a measured quantity to its actual (true) value.  
9) Precision, also called reproducibility or repeatability, is the degree to which further measurements show the same result.  
10) One sigma @ 150m range under RIEGL test conditions.  
11) Rounded values.  
12) User selectable.  
13) If the laser beam hits, in part, more than one target, the laser's pulse power is split accordingly. Thus, the achievable range is reduced.  
14) Measured at the  $1/e^2$  points. 0.30 mrad corresponds to an increase of 30 cm of beam diameter per 1000 m distance.

Technical Data to be continued on page 5 and 6

GREEN LASER CHANNEL

Range Measurement Performance

Measuring Principle	time of flight measurement, echo signal digitization, online waveform processing, full waveform recording for post processing
Hydrography	
Typ. Measurement Range	1.5 Secchi depths <sup>1)</sup> for bright ground ( $\rho \geq 80\%$ ) <sup>2)</sup>
Enhanced Depth Performance <sup>3)</sup>	up to 1.7 Secchi depths (averaging 10 waveforms) up to 2.0 Secchi depths (averaging 100 waveforms)
Topography (diffusely reflecting targets)	
Max. Measurement Range <sup>4) 5) 6) 7)</sup>	
natural targets $\rho \geq 20\%$	2500 m
natural targets $\rho \geq 60\%$	3600 m
Minimum Range	10 m
Accuracy <sup>8) 10)</sup>	25 mm
Precision <sup>9) 10)</sup>	25 mm
Laser Pulse Repetition Rate	up to 700 kHz <sup>4)</sup>
Max. Effective Measurement Rate <sup>4)</sup>	200 000 meas./sec (@ 200 kHz PRR) 400 000 meas./sec (@ 400 kHz PRR) 550 000 meas./sec (@ 550 kHz PRR) 700 000 meas./sec (@ 700 kHz PRR)
Echo Signal Intensity	for each echo signal, high-resolution 16 bit intensity information is provided
Number of Targets per Pulse	online waveform processing: up to 9, depending on measurement program <sup>11)</sup>
Laser Wavelength	532 nm, green
Laser Beam Divergence	selectable, 0.7 up to 2.0 mrad <sup>12)</sup>
Laser Beam Footprint (Gaussian Beam Definition)	100 mm @ 100 m, 500 mm @ 500 m, 1000 mm @ 1000 m <sup>13)</sup>

Scanner Performance

Scanning Mechanism / Scan Pattern	rotating prism / circular
Field of View (selectable)	$\pm 20^\circ = 40^\circ$
Scan Speed (selectable)	30 - 80 lines per second (lps) <sup>14)</sup>
Angular Step Width $\Delta \vartheta$ (selectable)	$0.02^\circ \leq \Delta \vartheta \leq 0.052^\circ$ (for PRR 550 kHz)
between consecutive laser shots	
Angle Measurement Resolution	better than $0.001^\circ$ (3.6 arcsec)

- 1) The Secchi depth is defined as the depth at which a standard black and white disc deployed into the water is no longer visible to the human eye.

2) at 650 m flight altitude

3) Achievable by waveform averaging which is applied in post processing.

4) rounded values

5) The following conditions are assumed:  
target larger than the footprint of the laser beam, average ambient brightness, visibility 23 km, perpendicular angle of incidence, ambiguity to be resolved multiple-time-around processing.

6) In bright sunlight, the operational range may be considerably shorter than under an overcast sky.

7) additional roll angle  $\pm 5^\circ$
- 8) Accuracy is the degree of conformity of a measured quantity to its actual (true) value.

9) Precision, also called reproducibility or repeatability, is the degree to which further measurements show the same result.

10) Topography, one sigma @ 150m range under RIEGL test conditions.

11) If the laser beam hits, in part, more than one target, the laser's pulse power is split accordingly. Thus, the achievable range is reduced.

12) Measured at the  $1/e^2$  points. 1.0 mrad corresponds to an increase of 100 mm of beam diameter per 100 m distance.

13) The laser beam footprint values correspond to a beam divergence of 1mrad.

14) One line corresponds to a full revolution (360°) of the scan mechanism which can be split into two user-defined segments.
